

Cvent Pre-Launch QA Checklist

A practitioner’s operational pass before you open registration.

AUDIENCE	Event Managers, Meetings & Events leads, Cvent Owners and Admins
FORMAT	14 sections · 112 checks · ownership and status fields per check
USE	Run before launch, before invite sends, before reminders, before event week

How to use this checklist.

Most registration issues that reach attendees were preventable at the QA pass before launch — and most teams know that, but run out of time to do the QA cleanly under timeline pressure. This checklist is the operational pass. It is intended to be used, not read.

What a clean pre-launch QA pass affects

- **Attendee experience.** Registration is the first digital touch of your event. A broken confirmation email, a wrong time zone, or a form field that fails on mobile is a friction point at exactly the moment you've earned the attendee's attention.
- **Stakeholder confidence.** Issues caught before launch are operational. Issues caught after launch are visible — often to executives, sponsors, or speakers — and they erode confidence in the program.
- **Reporting readiness.** Almost every reporting headache traces back to upstream setup decisions: field structure, segmentation, attribution data capture. The pre-launch pass is the last and best moment to catch these before they harden into months of manual cleanup.

Who this checklist is for

- **Event Managers and Event Planners** building registration in Cvent.
- **Meetings & Events Managers** signing off across a team's portfolio.
- **Cvent Owners and Admins** carrying the technical configuration.
- **Lean commercial event team leaders** running registration alongside broader marketing or sales responsibilities.

The checks are calibrated to mid-market enterprise event teams running Cvent. They translate directly to most program shapes — customer events, partner events, roadshows, conferences, internal events.

How each check is structured

For every check, the same four fields apply:

- **Why it matters.** The operational reason this check exists.
- **Common issue to catch.** The specific thing that tends to go wrong in real Cvent builds.
- **Owner.** Who is responsible for verifying this check (assign by name).
- **Status.** Whether the check is complete, has an open issue, or is not applicable. Use whatever convention your team prefers (✓ / Issue / N/A; or initials + date; or a ticket number).

When to use this checklist.

The pass is most valuable at five moments in the event cycle. Sections matter more or less at each moment; running the full pass at every gate is the safest discipline.

MOMENT	WHEN	SECTIONS TO PRIORITIZE
Before registration launch	7 days before opening registration	All sections — this is the full pass
Before invite sends	24–48 hours before invite blast	A, B, C, F, I, K, L
Before reminder emails fire	24 hours before each reminder send	F, G, I
Before event week	7 days before the event	D, F, G, H, J, M
Before publishing the Attendee Hub	7 days before Hub go-live (if applicable)	N, plus revisit A, D, K
After major registration changes	Within 24 hours of any change	The sections affected by the change, plus M

Rule of thumb. When in doubt, re-run the full pass. The cost of a re-run is hours; the cost of a missed issue is reputation.

The 14 sections at a glance

SECTION	TITLE
A	Event Website / Registration Page
B	Registration Paths
C	Registration Questions and Logic
D	Session Selection
E	Pricing / Payment (if applicable)
F	Confirmation Emails
G	Attendee Communications (Reminders, Updates, Day-Of)
H	Modification / Cancellation Flow
I	Invitee and Attendee Data
J	Stakeholder Review
K	Mobile / Device Testing
L	Accessibility / Readability
M	Final Go-Live Readiness
N	Attendee Hub & Event App (if applicable)

A Event Website / Registration Page

WHY THIS SECTION MATTERS

The website is the first impression of your event. A broken hero image, a wrong date, or placeholder copy from a previous event erodes confidence before registration even begins.

1. URL structure is clean and matches your event naming convention. *(Only applicable for events hosted with a custom domain.)*

WHY URLs are shared in invites, signatures, and follow-ups. A messy or default Cvent URL signals an unfinished build.

COMMON ISSUE Default cvent.me link being used in the invite when a custom URL was configured but never swapped in.

OWNER _____

STATUS _____

2. Brand colors, logos, and fonts render correctly across major browsers.

WHY Brand integrity is part of attendee experience. Inconsistent rendering reads as unfinished.

COMMON ISSUE Custom font that fails to load in Outlook-rendered preview links or older browser versions.

OWNER _____

STATUS _____

3. Event information accurate. Title, date and time with explicit time zone, location, registration window, Event Planner (which doubles as the default From Name in your emails), and Event Features all match the master event record.

WHY Wrong dates or times propagate to confirmations and calendar invites. The Event Planner field flows into outbound email From Names if not overridden.

COMMON ISSUE Time displayed in the wrong zone for a multi-region audience; "9:00 AM" without specifying EST vs PST.

OWNER _____

STATUS _____

4. All CTAs on the website point to the correct registration path or page.

WHY CTA misroutes drop attendees into the wrong path or surface the wrong pricing.

COMMON ISSUE "Register" button still pointing to a previous event's registration page.

OWNER _____

STATUS _____

5. Mobile rendering tested on at least one iOS and one Android device. Header, navigation, image scaling, and CTA size all work.

WHY A meaningful share of registrations happen on mobile. Issues here are invisible if you only test on desktop.

COMMON ISSUE Hero image that gets cropped on mobile and hides the CTA.

OWNER _____

STATUS _____

6. Page load speed acceptable on a standard connection.

WHY Slow load is a silent drop-off. Most teams don't measure it until after launch.

COMMON ISSUE Heavy hero video or carousel image set producing a noticeably slow load on a typical mobile connection.

OWNER _____

STATUS _____

7. No placeholder copy remains anywhere on the public site. No "lorem ipsum," no "TBD," no "[insert speaker bio]," no "Confirm date with venue."

WHY Placeholder copy that ships is a credibility loss the team rarely recovers from in front of attendees.

COMMON ISSUE Speaker bio left as "TBD" because the bio came in late and never got swapped.

OWNER _____

STATUS _____

8. Validate and publish discipline. Run Cvent's validation against the website and registration process for errors, then publish via Site Designer so changes propagate to invitees. Public/private event setting and search engine settings reviewed. Standard weblinks and Reference IDs documented for marketing assets.

COMMON ISSUE Edits made in the builder but never published, so invitees see the prior version of the page.

OWNER _____

STATUS _____

B Registration Paths

WHY THIS SECTION MATTERS

Path configuration determines who sees what pricing, what questions, and what experience. Path errors are the most common source of attendee confusion and stakeholder embarrassment.

1.

All registration types are defined and verified. General Admission, VIP, Speaker, Sponsor, Comp, Internal Staff, Press — whatever your program needs. For each type, the correct admission items, agenda items, optional items, fees, hotel rooms, custom webpages, and badges are associated. If the event was copied from a prior event, registration types and their associations are re-verified and renamed where needed.

COMMON ISSUE Registration types copied from a previous event still carrying the prior event's items or naming, surfacing in the path-selection UI as "VIP-2024."

OWNER

STATUS
2.

Each path has the correct fee structure or comp logic. Tested with a pre-launch test registration.

COMMON ISSUE Sponsor path showing GA pricing because the discount logic was attached to the wrong code.

OWNER

STATUS
3.

Path-specific questions render only for the right path — no leakage of internal-only or path-specific questions to public attendees.

COMMON ISSUE Unwanted question appearing in the GA path because the visibility rule wasn't set.

OWNER

STATUS
4.

Path-specific confirmation emails are wired to the right template.

COMMON ISSUE Speakers receive the GA confirmation instead of the speaker logistics confirmation.

OWNER

STATUS
5.

Path capacity limits are set if applicable. Waitlist behavior is defined and tested.

COMMON ISSUE VIP path with no capacity limit, allowing more registrations than seats.

OWNER

STATUS
6.

Path access controls are configured correctly. Direct registration link, password-protected, invitation-only is set per path requirement.

COMMON ISSUE Comp-code path accessible via the public registration link.

OWNER

STATUS
7.

Internal-only paths are hidden from public view. Staff and rehearsal paths are not surfaced in the path-selection UI to public attendees.

COMMON ISSUE Internal staff path visible to external attendees who self-select it.

OWNER

STATUS
8.

Path naming is consistent across the registration UI, reports, and downstream integrations.

COMMON ISSUE "VIP" in the registration UI, "VIP_Premium" in the report, "VIP-PREM" in Salesforce. Reporting becomes a translation exercise.

OWNER

STATUS

C Registration Questions and Logic

WHY THIS SECTION MATTERS

Questions and logic are where the most subtle bugs live. They survive casual testing because the bug only triggers in specific combinations.

1. All required questions are marked required; optional questions are clearly optional.

COMMON ISSUE Required field that's actually nullable in the database, allowing incomplete records through.

OWNER _____ STATUS _____

2. Question types match the data needed. Text vs. dropdown vs. multi-select vs. address block — each matches the downstream use.

COMMON ISSUE Free-text "Country" field that creates 47 spellings of "United States" in reporting.

OWNER _____ STATUS _____

3. Field-level validation is tested. Email format, phone format, character limits all work as expected.

COMMON ISSUE International phone numbers rejected by US-only validation.

OWNER _____ STATUS _____

4. Pre-fill from invite link or CRM is tested where applicable. Tokens render correctly; missing tokens fall back gracefully.

COMMON ISSUE "Hi {{first_name}}" rendering literally because the CRM field is empty.

OWNER _____ STATUS _____

5. Question ordering follows the attendee mental model. No jarring jumps from logistics to deeply personal questions and back.

COMMON ISSUE Dietary requirements asked before name and email; attendee abandons.

OWNER _____ STATUS _____

6. Field labels match the column names you'll need in reporting. Where a question is going to be a report column, the label and the column align.

COMMON ISSUE "Job Title" in the form, "Title" in the report, "Position" in Salesforce. Cleanup tax forever.

OWNER _____ STATUS _____

7. Question codes added for any question whose response will pull into emails or other downstream surfaces via data tags. Without a question code, the data tag won't resolve in the email body.

COMMON ISSUE Personalized email body referencing a registration question whose code was never added; the data tag renders as raw text or nothing.

OWNER _____ STATUS _____

8. Sensitive personal data and travel data routed to the right inputs. Passport number, date of birth, and similar sensitive fields use Cvent's dedicated encrypted contact fields — not custom registration questions. Flight, air, and hotel data flow through Cvent's air request, air actual, or hotel request forms — not through custom registration questions.

COMMON ISSUE Sensitive identifiers collected via free-text registration questions, leaving them outside the platform's encrypted-field handling.

OWNER _____ STATUS _____

D Session Selection

WHY THIS SECTION MATTERS

Session selection has the highest density of edge cases per square inch of registration. Capacity, conflicts, time zones, and modification flows all interact.

1. All sessions configured with correct date, time, and time zone. Verify against the master agenda.

COMMON ISSUE Time zone mismatch between Cvent display and the calendar invite (event runs in EST; ICS shows PST).

OWNER _____ STATUS _____

2. Concurrent sessions are properly grouped. An attendee can only choose one per time slot.

COMMON ISSUE Two concurrent sessions both selectable, attendee registered for both, no error surfaced.

OWNER _____ STATUS _____

3. Session capacity limits are set; waitlist behavior is defined.

COMMON ISSUE Capacity set, but waitlist not configured — registrations bounce instead of joining a waitlist.

OWNER _____ STATUS _____

4. Session-specific questions are wired correctly (e.g., dietary requirements for a dinner session).

COMMON ISSUE Dietary question shown to all attendees instead of only those attending the dinner.

OWNER _____ STATUS _____

5. Modification flow respects current session capacity. Attendees changing sessions can't bypass the cap.

COMMON ISSUE Modification flow lets an attendee join a session that closed during the registration window.

OWNER _____ STATUS _____

6. Session conflicts surface to the attendee at selection time. No silent overlap.

COMMON ISSUE Attendee selects two overlapping sessions and only finds out at the door.

OWNER _____ STATUS _____

7. Session naming is consistent across the registration page, the calendar invite, and reports.

COMMON ISSUE "Keynote" on the website, "Opening Keynote" in the calendar invite, "K1" in the report.

OWNER _____ STATUS _____

8. Walk-in / on-site session adjustments are planned. The team knows how to handle a session change at the venue.

COMMON ISSUE Walk-in flow not documented, leading to ad-hoc admin during the event.

OWNER _____ STATUS _____

E Pricing / Payment (if applicable)

WHY THIS SECTION MATTERS

Money is the most visible and least forgiving area of the registration build. Pricing errors propagate fast and stay in everyone's memory.

1. All pricing tiers tested. Early bird, regular, late, group discount, comp.

COMMON ISSUE Early bird pricing not charged correctly because the cutoff dates in the back end are not set correctly.

OWNER _____ STATUS _____

2. Comp codes generate the correct discount. Tested in Perform Test Mode.

COMMON ISSUE Comp code stacks with another discount, producing a negative balance the system processes.

OWNER _____ STATUS _____

3. Tax calculations (where applicable, especially events based out of Canada) are tested. Tax fires after discount, not before; tax rates match jurisdiction.

COMMON ISSUE Tax not created in the platform or not active.

OWNER _____ STATUS _____

4. Payment processor sandbox or test transaction completed. Real card or test card, depending on processor.

COMMON ISSUE Production payment processor not yet activated for the new event, causing all live payments to fail at launch.

OWNER _____ STATUS _____

5. Refund policy logic is tested. Full, partial, none — match the published policy.

COMMON ISSUE System policy doesn't match the FAQ, leading to disputes.

OWNER _____ STATUS _____

6. Receipt and invoice templates populated with correct fields. Legal entity, address, tax ID where required.

COMMON ISSUE Receipt that shows the previous event's name in the line item.

OWNER _____ STATUS _____

7. Currency display matches stakeholder expectations across multi-region events.

COMMON ISSUE USD displayed to EU attendees who expected EUR; sponsorship invoices in the wrong currency.

OWNER _____ STATUS _____

8. Pricing components and payment configuration verified. Fees, refund policies, discount codes, and volume discounts associated to the correct agenda items. Service fees activated and associated to the correct registration types. Summary and Payment Widget configured. Event prefix, merchant account, currency, and allowed payment methods finalized.

COMMON ISSUE A discount code or service fee left associated to a prior event's agenda item, surfacing an unintended price line at registration.

OWNER _____ STATUS _____

F Confirmation Emails

WHY THIS SECTION MATTERS

The confirmation email is the artifact attendees actually keep. If it has the wrong date, time zone, or a broken calendar invite, every attendee experiences the issue.

1. Confirmation email content matches each registration path. GA gets GA, speaker gets speaker, sponsor gets sponsor.

COMMON ISSUE All paths use the same confirmation template; speakers don't receive their logistics info.

OWNER _____ STATUS _____

2. ICS / calendar invite is attached and renders correctly in major calendar apps. Outlook, Google Calendar, Apple Calendar.

COMMON ISSUE The ICS link and any other calendar links should be checked to ensure they create the correct, intended calendar entry for registrants who opt to mark their calendars.

OWNER _____ STATUS _____

3. Confirmation includes correct event date, time, time zone, location. Verified against the source of truth.

COMMON ISSUE Time zone label missing — attendees in different zones interpret “5 PM” differently.

OWNER _____ STATUS _____

4. Reply-to address is monitored (or set to a documented no-reply with clear escalation path in the email body).

COMMON ISSUE Reply-to set to an unmonitored address; attendees with last-minute issues bounce.

OWNER _____ STATUS _____

5. Spam-trigger phrasing avoided in subject line and body. No all-caps, no suspicious-link patterns.

COMMON ISSUE “URGENT: Confirm Your Registration” subject line landing in spam at major corporate domains.

OWNER _____ STATUS _____

6. Confirmation links (modify, cancel) tested end-to-end.

COMMON ISSUE Modification not activated from registration path settings.

OWNER _____ STATUS _____

7. Sender domain authentication (SPF, DKIM, DMARC) verified.

COMMON ISSUE DKIM not signed for the new sender domain, increasing spam-folder placement.

OWNER _____ STATUS _____

8. Email setup discipline. Each event email (invitation, confirmation, reminders) is active and built in the Email Designer. The plain text version mirrors the HTML version. Click tracking is finalized. Each email is scheduled at the correct date and time.

COMMON ISSUE Email content updated in HTML but the plain text version still reflects an earlier draft.

OWNER _____ STATUS _____

G Attendee Communications

Reminders, Updates, Day-Of

WHY THIS SECTION MATTERS

Reminders and day-of communications are sent to people who already trust you enough to register. The bar for these is higher than for invites.

1. Pre-event reminder schedule defined. Typical cadence: 30 days, 14 days, 7 days, 1 day, day-of.

COMMON ISSUE Reminders all firing on the same day because the schedule wasn't time-zoned.

OWNER _____ STATUS _____

2. Each reminder has unique content. Don't send the same email four times.

COMMON ISSUE Four "Looking forward to seeing you" emails landing back-to-back, training attendees to ignore them.

OWNER _____ STATUS _____

3. Day-of communications are planned. Parking, check-in, schedule, contact info.

COMMON ISSUE Day-of email with no contact info for issues at the venue.

OWNER _____ STATUS _____

4. Communications include explicit time zone when audience spans multiple zones.

COMMON ISSUE "Doors open at 8 AM" without zone — global attendees show up at the wrong hour.

OWNER _____ STATUS _____

5. Reminders link to event resources — agenda, speaker bios, mobile app, venue map.

COMMON ISSUE Reminders without links, requiring attendees to find the original confirmation.

OWNER _____ STATUS _____

6. Brand voice consistent across all communications. Marketing's tone matches event ops' tone.

COMMON ISSUE Marketing reminders read as a campaign; event-ops reminders read as a vendor; attendees get whiplash.

OWNER _____ STATUS _____

7. Final pre-event checks scheduled for the morning of the event. Last-minute change protocol agreed.

COMMON ISSUE Final check missed; an outdated venue map ships in the day-of email.

OWNER _____ STATUS _____

8. Virtual / hybrid readiness, where applicable. Each guest's unique access link is delivered in the confirmation and the day-of reminder. The calendar invite description references the access link. The end-to-end guest flow has been tested as an actual registrant. A day-of support plan is ready — who escalates if a guest can't access, what email goes out if the streaming or chat provider is down.

COMMON ISSUE Day-of email refers to the platform but doesn't include the unique access link, sending guests back to find their original confirmation.

OWNER _____ STATUS _____

H Modification / Cancellation Flow

WHY THIS SECTION MATTERS

The modification and cancellation flows are tested less than the registration flow but are equally important. They determine how attendees experience changing their minds.

1. Modify-registration link in confirmation tested end-to-end.

COMMON ISSUE Modify link that opens a generic registration page instead of the attendee's existing record.

OWNER _____ STATUS _____

2. Modification flow respects session capacity. Attendees changing sessions cannot bypass the cap.

COMMON ISSUE Attendee modifies into a closed session because the modification flow doesn't check capacity.

OWNER _____ STATUS _____

3. Modification triggers an updated confirmation email.

COMMON ISSUE Modification saved silently; attendee unsure if the change took effect.

OWNER _____ STATUS _____

4. Cancel-registration link tested end-to-end.

COMMON ISSUE Cancel link that requires login credentials the attendee doesn't have.

OWNER _____ STATUS _____

5. Cancellation policy displayed clearly before final cancellation.

COMMON ISSUE Refund policy buried; attendee cancels then disputes the partial-refund decision.

OWNER _____ STATUS _____

6. Cancellation triggers confirmation email and any internal notifications.

COMMON ISSUE Internal team unaware a sponsor canceled until they show up at the venue with no booth.

OWNER _____ STATUS _____

7. Refund logic on cancellation matches the policy. No, partial, or full refund — applied correctly.

COMMON ISSUE Refund logic that triggers a full refund when policy specifies partial.

OWNER _____ STATUS _____

8. Modification configuration and supporting pages reviewed. Modification Dates are set per registration path so registrants can modify within the intended window. Regret survey, cancellation survey, guest information page, and waitlist page are all reviewed and in order.

COMMON ISSUE Modification window not configured on a path that allows modifications, so the modify link surfaces but no edits save.

OWNER _____ STATUS _____

Invitee and Attendee Data

WHY THIS SECTION MATTERS

Data hygiene at the registration step determines reporting cleanliness for the next six months. This is where upstream → downstream lives.

1. Invitee list is de-duplicated before upload. Especially across CRM segments.

COMMON ISSUE The same person on three lists receives three invites with different personalization tokens.

OWNER _____ STATUS _____

2. Personalization tokens tested with both populated and empty fallback values.

COMMON ISSUE "Dear {{first_name}}," rendered literally for invitees whose first name field is empty.

OWNER _____ STATUS _____

3. Email field validation prevents bad emails from triggering bounces.

COMMON ISSUE Trailing space or capitalization issue causing high-volume bounces from a single bad list segment.

OWNER _____ STATUS _____

4. Source / UTM tracking captured at registration. UTM parameters from invite links flow into Cvent reporting fields.

COMMON ISSUE UTM lost at the registration step because the field isn't configured to capture it.

OWNER _____ STATUS _____

5. Custom fields populated where needed. Account, segment, region, partner code — whatever the program requires.

COMMON ISSUE Custom field added but not surfaced in the registration form or pre-fill, leaving the field empty for everyone.

OWNER _____ STATUS _____

6. Data sync to CRM / marketing automation tested with a real registration.

COMMON ISSUE Sync works for most fields but silently drops one — discovered weeks later.

OWNER _____ STATUS _____

7. Privacy / consent fields configured per jurisdiction. GDPR, CCPA, and any region-specific requirements where applicable.

COMMON ISSUE Consent checkbox missing for EU attendees; legal exposure increases as registrations come in.

OWNER _____ STATUS _____

8. Privacy and compliance setup verified. Privacy policy is visible on the event website. Cookie notification is configured for jurisdictions that require it. CCPA "Do Not Sell or Share" options are set if applicable. Contact snapshot configuration matches the event's data retention practice. Invitation list reviewed end-to-end — everyone who should receive an email is on it.

COMMON ISSUE Cookie notification or privacy policy link configured for a prior event but not refreshed for the new build.

OWNER _____ STATUS _____

J Stakeholder Review

WHY THIS SECTION MATTERS

Stakeholder issues caught after launch are public; stakeholder issues caught before launch are operational. The pre-launch sign-off is what separates the two.

1. Key stakeholders have reviewed the registration page. Marketing, sales, exec sponsor, brand owner.

COMMON ISSUE Exec sponsor sees the page for the first time after launch and finds an issue everyone else missed.

OWNER _____ STATUS _____

2. Brand approval signed off. Logos, colors, taglines, photography all match brand guidelines.

COMMON ISSUE Brand asks for the previous brand mark; the new one was applied but not approved.

OWNER _____ STATUS _____

3. Legal / compliance review completed. T&Cs, privacy policy, refund policy, code of conduct.

COMMON ISSUE Legal review scheduled after launch, leading to last-minute T&C changes.

OWNER _____ STATUS _____

4. Speakers, sponsors, and VIPs notified of their custom paths and have tested their flow.

COMMON ISSUE Speaker registers via the GA path because the custom link wasn't shared with them.

OWNER _____ STATUS _____

5. Internal demo / walkthrough conducted with the event team.

COMMON ISSUE On-site staff sees the registration page for the first time during the event.

OWNER _____ STATUS _____

6. Sign-off captured and dated for audit trail.

COMMON ISSUE Verbal sign-off; later disputes about what was approved when.

OWNER _____ STATUS _____

7. Edge cases discussed. Over-capacity, technical failure, payment issues — escalation paths agreed.

COMMON ISSUE Over-capacity handling decided ad-hoc during the event because no policy was set.

OWNER _____ STATUS _____

8. Communication plan for issues during event week is agreed. Who owns what, who gets paged, who decides.

COMMON ISSUE Critical issue at 6 AM on event day with no clear decision-maker available.

OWNER _____ STATUS _____

K Mobile / Device Testing

WHY THIS SECTION MATTERS

A meaningful share of registrations happen on mobile. Mobile-specific issues are invisible if the QA pass only happens on desktop.

1. Registration page tested on iPhone (Safari) and Android (Chrome). Current and prior major version.

COMMON ISSUE Android Chrome rendering the date picker differently from iOS Safari, breaking date selection.

OWNER _____ STATUS _____

2. Form fields render correctly on mobile. No overlap, no cut-off, no horizontal scroll.

COMMON ISSUE Long dropdown options cut off mid-text on narrow screens.

OWNER _____ STATUS _____

3. Mobile keyboard appears appropriately per field type. Numeric for phone, email keyboard for email, etc.

COMMON ISSUE Email field showing the standard alphanumeric keyboard, slowing entry.

OWNER _____ STATUS _____

4. CTA button is tappable. 44×44 minimum touch target.

COMMON ISSUE Submit button squeezed below the fold and partially overlapping with another CTA.

OWNER _____ STATUS _____

5. Confirmation page renders cleanly on mobile.

COMMON ISSUE Confirmation page that scrolls forever because the desktop layout doesn't collapse.

OWNER _____ STATUS _____

6. Mobile load time tested on a non-WiFi connection.

COMMON ISSUE Low load speed on a typical mobile connection that desktop tests never surface.

OWNER _____ STATUS _____

7. Tested in both portrait and landscape orientation.

COMMON ISSUE Landscape view that breaks the form layout on tablets.

OWNER _____ STATUS _____

8. Browser compatibility checked. Chrome, Safari, Firefox, Edge — current and prior major version.

COMMON ISSUE Firefox rendering issue that nobody catches because the team uses Chrome.

OWNER _____ STATUS _____

L Accessibility / Readability

WHY THIS SECTION MATTERS

Accessibility is both compliance and attendee experience. A registration page that excludes some users excludes the brand from those users.

1. Color contrast meets WCAG AA standards for body text and CTAs.

COMMON ISSUE “Secondary” CTA in light gray on white that fails AA contrast.

OWNER _____ STATUS _____

2. Form labels properly associated with inputs. Screen reader compatibility verified.

COMMON ISSUE Labels positioned above inputs visually but not programmatically associated; screen readers don't announce the field name.

OWNER _____ STATUS _____

3. Tab order through the form is logical.

COMMON ISSUE Tab order that skips the dropdown and lands on the submit button two fields early.

OWNER _____ STATUS _____

4. Error states are perceivable visually and to assistive tech. Color alone is not the only error indicator.

COMMON ISSUE Red border on invalid field with no text or ARIA error message; colorblind or screen-reader users miss the error entirely.

OWNER _____ STATUS _____

5. Keyboard navigation works without a mouse. Form completable via keyboard alone.

COMMON ISSUE Custom dropdown that doesn't open via keyboard.

OWNER _____ STATUS _____

6. Reading level appropriate for the audience. Avoid jargon and complex sentence structures where they don't add value.

COMMON ISSUE Legal language in the body of the registration page that scares attendees away.

OWNER _____ STATUS _____

7. Alt text present on key event imagery.

COMMON ISSUE Hero image without alt text; screen reader announces “image” with no context.

OWNER _____ STATUS _____

8. Time zone labels explicit. No “5 PM” without zone.

COMMON ISSUE “Doors at 5 PM” — attendees in a different zone show up at the wrong hour.

OWNER _____ STATUS _____

M Final Go-Live Readiness

WHY THIS SECTION MATTERS

This is the last gate. Sections A–M can each be clean individually; this section verifies they hold together as a coordinated launch.

1. **All sections above are checked off. Open issues are either resolved or explicitly accepted by an owner.**
 COMMON ISSUE “We’ll fix it after launch” issues that turn into post-launch fires.
 OWNER _____ STATUS _____
2. **Test registration completed end-to-end. A real attendee path, from invite open through confirmation receipt.**
 COMMON ISSUE Path tested in pieces but never as a single flow; an integration breaks at the seam between two sections.
 OWNER _____ STATUS _____
3. **Production data and test data clearly separated.**
 COMMON ISSUE Test data accidentally shipped in the production registration count.
 OWNER _____ STATUS _____
4. **Test registrations deleted or flagged before invites send.**
 COMMON ISSUE “Test User” with the team’s email visible in the public attendee list.
 OWNER _____ STATUS _____
5. **Internal team notified of go-live time. Marketing, sales, exec sponsor, support all know when registration opens.**
 COMMON ISSUE Sales reaches out to invitees before the registration page is actually live.
 OWNER _____ STATUS _____
6. **Monitoring window planned for the first 24 hours after launch. Planner Alerts configured so the right people are notified of key registration events. Someone is watching for issues, not assuming everything’s fine.**
 COMMON ISSUE Bug at 9 PM on launch day; nobody notices until 9 AM the next morning.
 OWNER _____ STATUS _____
7. **Issue triage process documented. Who fixes what, by when, with what authority.**
 COMMON ISSUE Critical issue surfaces; team spends 30 minutes deciding who owns it before fixing.
 OWNER _____ STATUS _____
8. **Stakeholder sign-off captured at the final go/no-go check-in. Feedback Survey configured and ready for post-event distribution.**
 COMMON ISSUE Implicit go-ahead; later dispute about whether launch was approved.
 OWNER _____ STATUS _____

N Attendee Hub & Event App

If applicable

WHY THIS SECTION MATTERS

For events that publish a Cvent Attendee Hub (Event App + Attendee Website), publishing is a separate launch gate from registration. The Event App and Attendee Website are published separately and cannot be removed from the event after publishing — so the pre-publish pass deserves its own discipline.

- 1. Featured content selected. Featured speakers, featured sessions, and featured exhibitors are set per the event's feature priorities. Session videos are uploaded for any pre-recorded virtual or hybrid sessions; the file delivery deadline agreed with your Solutions Specialist is met.**

COMMON ISSUE Featured speakers carried over from a copied event; session videos referenced but the files not yet delivered to the file-share location.

OWNER _____ STATUS _____

- 2. Authentication and privacy configured. Post-registration authentication method set to the secure verification code option. "Do Not Sell or Share" setting reviewed and the relevant URL entered if applicable. Terms of Use displayed if your organization uses one. Note: Terms of Use text cannot be changed after an attendee has accepted from the Event App or Attendee Website.**

COMMON ISSUE Terms of Use text published with placeholder language, then locked once the first attendee accepts.

OWNER _____ STATUS _____

- 3. Attendee opt-in for exhibitors reviewed. The wording of the opt-in question and choices reflects the event's privacy stance and exhibitor agreements.**

COMMON ISSUE Default opt-in wording used unchanged; doesn't match the contracted exhibitor data-sharing terms.

OWNER _____ STATUS _____

- 4. Exhibitor setup verified. Featured exhibitors selected. Exhibitor meetings, appointments, content, sponsorship levels, sponsored sessions, and inbound leads configured per the event's exhibitor program.**

COMMON ISSUE Exhibitor appointments enabled but the underlying setup (availability, time slots) incomplete, surfacing an empty booking interface to attendees.

OWNER _____ STATUS _____

- 5. Design assets uploaded in the Website and App Builder. Event icon, splash screen (with the safety margins respected), website banner, logo, and any header images are uploaded. Theme colors and mood selected.**

COMMON ISSUE Splash screen uploaded without respecting the recommended safety margins; key elements get cropped on certain device sizes.

OWNER _____ STATUS _____

- 6. Profile editing and visibility set. Profile editing is allowed or disabled per the program. Attendee profile visibility (hidden vs. visible by default) confirmed against the privacy stance.**

COMMON ISSUE Default profile visibility left as "visible" for an event whose attendee list is meant to stay private.

OWNER _____ STATUS _____

- 7. Event access, visibility, and login configured. Event assigned to the right space if used. Event visibility within the Cvent Events app set (visible or hidden, and whether an Event ID is required to access). Login requirements set per page so the right pages are gated.**

COMMON ISSUE Event marked visible in the Cvent Events app when the program intends invite-only access via Event ID.

OWNER _____ STATUS _____

- 8. Publish, share, and dry-run. Event App and Attendee Website published separately when ready. Website link shared with attendees per the launch plan; Event App download link distributed if used. A dry run completed for any virtual sessions before go-live.**

COMMON ISSUE Attendee Website published but the link not yet distributed in any reminder email; attendees discover it day-of with no time to acclimate.

OWNER _____ STATUS _____

RED FLAGS · PAUSE LAUNCH CRITERIA

Red flags — pause launch until resolved.

If any of the following are open at the go/no-go check, **pause the launch**. None of these is worth shipping past.

01 Confirmation email firing with wrong content (path mismatch, prior event template still active, or attached ICS / calendar link generates an unintended entry).	02 Calendar invite (ICS) showing wrong date, wrong time zone, or producing the wrong intended calendar entry for registrants.
03 Pricing setup broken — e.g., early-bird cutoff dates not set correctly in the back end, or pricing components not associated to the right agenda items.	04 Comp code logic broken — overcharging or undercharging attendees.
05 Required field that's not actually required in the database (data integrity issue).	06 Stakeholder rejection or disagreement that hasn't been resolved.
07 Legal or compliance items unresolved.	08 Test data not separated from production data, or test registrations still present at invite send.
09 Mobile registration broken on a major device.	10 Payment processor not active for the new event in production.
11 Privacy / consent missing for any jurisdiction with active attendees.	12 Sensitive personal data (passport, date of birth, similar) being collected via custom registration questions instead of Cvent's dedicated encrypted contact fields.

A delayed launch is recoverable. A broken launch ships forward and gets harder to fix the longer it runs.

THE LAUNCHHOUSE LENS

A practitioner's resource — carried alongside your team.

This checklist is a practitioner's resource. It is intended to be used by your team, on your build, in your workflow.

Where a specialist Cvent registration operations partner can reduce load: pre-launch QA is one of the highest-leverage moments in the event cycle, and one of the easiest to compress under timeline pressure. LaunchHouse provides the registration operations layer that carries the QA discipline alongside your team — the work in this checklist, run by a specialist, without disrupting the build you already have in flight.

LaunchHouse does not replace your team. We do not run your event. We carry the build, QA, and reporting setup so your team stays focused on the event itself. If your team is short on capacity for any of the sections above in the weeks before launch, that's the layer we sit inside.

Premium Cvent registration operations support — built around your existing event team's workflow.

SUGGESTED USAGE

Use this checklist in five passes.

A team can use this checklist most effectively across five distinct passes — a routine that turns the artifact into a discipline rather than a one-time read.

- 01** **Adopt as the default pre-launch QA artifact for every registration build.** Save a fresh copy per event in your event-records folder; archive completed copies for audit and pattern-recognition over time.
- 02** **Assign each section to a specific team member.** The Owner column is the discipline that prevents diffuse ownership.
- 03** **Run the first pass 7 days before registration launch.** This catches structural issues early enough to fix without compressing other work.
- 04** **Re-run 3 days before launch with stakeholders looped in.** Final sign-off lives here.
- 05** **Re-run 24 hours before launch as the final go/no-go check.** Use the Red Flags section as the gating criterion.

After each launch, review the checklist with the team and capture any issues that surfaced *after* launch but should have been caught in the pass. Add or refine checks accordingly. The checklist gets sharper with every event run.

PROOF-SAFE GUARDRAILS

How this checklist stays honest.

The checklist is structured so the value lives in the checks themselves — not in inflated claims about who has used it or what outcomes it guarantees.

- The checklist does not claim that running it guarantees a smooth event. Outcomes depend on many factors beyond registration QA.
- The checklist does not claim LaunchHouse has run hundreds of pre-launch QA passes. It is a practitioner's resource, drawn from genuine Cvent operational judgment, calibrated to the work LaunchHouse is built to carry.
- The checklist does not position itself as a replacement for the team's own judgment. Every check has an owner; ownership stays with the team.
- The checklist does not claim aggregated client experience or named patterns ("In our experience delivering events for Fortune 500..."). It is structured around operational reality, not framed as scaled experience.
- The LaunchHouse Lens section is intentionally brief. The checklist is the value; the brand is the credit, not the pitch.

End of Cvent Pre-Launch QA Checklist v03.
